

Innovative service allows for making Skype with the mobile phone. The user remains available on Skype even when away from the PC.

- Skype in the mobile phone
- very scalable
- easy integration with existing network
- activation by text message

With the Moberia Skype.Phone platform the carrier allows its users to make Skype calls while at the same time monetizing the traffic. The solution allows to increase ARPU and reduce churn.

Moberia Skype.Phone—important features:

For User:

- SMS activation;
- functions:
 - voice calls to Skype;
 - Voice calls from Skype;
 - Sending and receiving text messages via SMS;
- Calls to skype for local tariff costs;

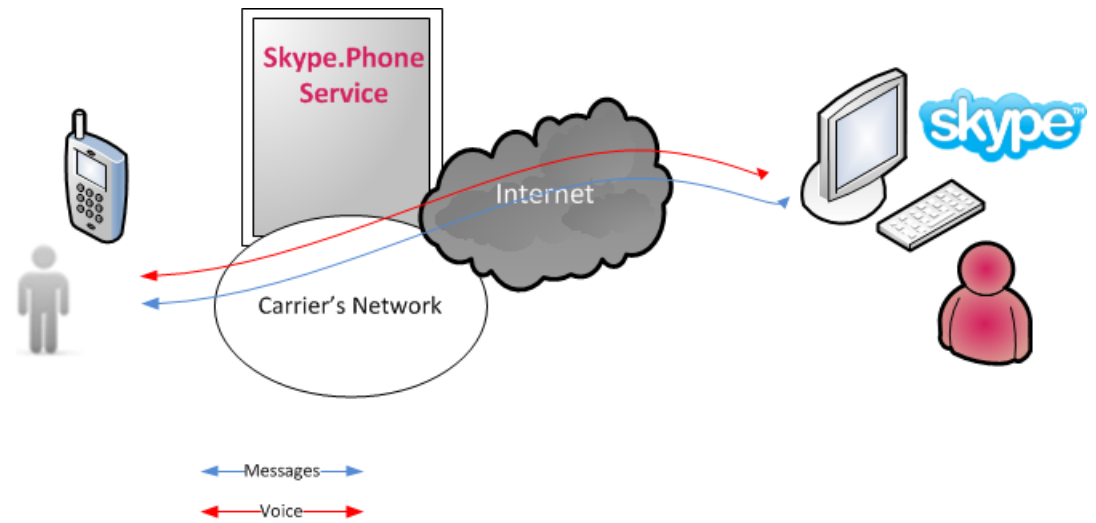

For Carrier:

- flexible, transparent integration with GSM network
- provisioning via SMS, does not require integration with carrier's provisioning system
- fast integration due to overlay type architecture
- additional stream of revenue
- attractive, innovative offer
- very short TTM

How does the service work?

Integracja Integration with carrier's network is very simple. The system integrates with SMSC via CIMD2 or SMPP links. In order to activate the service the user sends an SMS to a number specified by the carrier, the SMS is then routed to the Skype.Phone application server. USSD based integration is also possible. The Skype username and password is submitted in the SMS. Apart from SMSC connection the system also integrates with the carrier's switch via E1 link. In order to call via Skype the user dials a special number specified by the carrier and the call is routed to the Skype.Phone application server. The user then calls his Skype contact list buddies according to his Skype speed dial settings. Because Skype.Phone holds the Skype account information, it is also possible to receive calls from the Skype users on the mobile phone (on net call inside the network). It is also possible to send and receive messages to and from Skype via SMS.
